

TracMap

Technology Upgrade

As part of our continued investment in ability to deliver a quality job for our clients we have installed the TracMap GPS guidance system. This world leading technology was developed here in NZ, and means our spreaders are equipped with the most modern guidance system available today

What this means for you is we;

- have improved our ability to drive accurately and achieve an even fertiliser spread. This will mean a more even and optimum growth response for the fertiliser applied
- can more accurately measure and report area covered
- can produce a map at the conclusion of the job, which provides you with a good record of what was applied, where, and when

Below is an example of the type of map we can produce and send to you.

KEY

- Track when spreading
- Track when not spreading
- Start point
- Finish point

(Note, area covered calculation on map report includes overlap areas on headlands etc)
